Foreword

This publication presents information using an “indicator” approach, focusing on cross-country comparisons; the aim being to make the accounts more accessible and informative, whilst, at the same time, taking the opportunity to present the conceptual underpinning of, and comparability issues inherent in, each of the indicators presented.

The range of indicators is set deliberately wide to reflect the richness of the national accounts dataset and to encourage users of economic statistics to refocus some of the spotlight that is often placed on GDP to other important economic indicators, which may better respond to their needs. Indeed many users themselves have been instrumental in this regard. The report of the Commission on the Measurement of Economic Performance and Social Progress (Stiglitz-Sen-Fitoussi Commission) is but one notable example.

That is not to undermine the importance of GDP, which arguably remains the most important measure of total economic activity but other measures may better reflect other aspects of the economy. For example, net national income, may be a more appropriate measure of income available to citizens in countries with large outflows of property income and household adjusted disposable income per capita may be a better indicator of the material well-being of citizens. But certainly from a data perspective more can and remains to be done. The Stiglitz-Sen-Fitoussi Commission for example highlights the pressing need for the provision, by official statistics institutes, of more detailed information that better describes the distributional aspects of activity, especially income, and the need to build on the national accounts framework to address issues such as non-market services produced by households or leisure. It is hoped that by producing a publication such as this, so raising awareness, the momentum from this and other initiatives will be accelerated. The publication itself will pick up new indicators in the future as they become available at the OECD.

The publication is broken down into six chapters: The first provides a general introduction focusing on indicators of GDP. The second focuses on Income and presents a number of important indicators such as savings and net lending/net borrowing rates. The third chapter looks at indicators related to the Expenditure approach to GDP estimation, with information on the key components of demand and imports. The fourth chapter looks at indicators from a Production perspective. Fifth and sixth chapters focus on General Government and Capital respectively. Finally the annex provides important reference indicators, important in their own-right but also because they are used in the construction of many of the indicators presented elsewhere in the publication. It also provides further background on the new 2008 System of National Accounts, which will eventually be the basis of data published here. Indeed the indicators presented for Australia follow the 2008 SNA. For all other countries indicators are presented on the basis of the 1993 System of National Accounts. It's important to note however that differences between the 2008 SNA and the 1993 SNA do not have a significant impact on the comparability of indicators presented in this publication. The annex at the end of this publication describes the key changes from the 1993 SNA that impact on the indicators presented here and, for Australia, it also provides an indication of the size of the impact for the most important changes.

Reader's guide

Main features

Each indicator is preceded by a short text that opens with an explanation in general terms of what is measured and why. This is followed by a more detailed description of the underlying concept (Definition) consistent with the 1993 *System of National Accounts (SNA)*. The final paragraph (Comparability) highlights those areas where some caution may be needed when comparing performance across countries or over time. Some issues relating to comparability, or the care that should be taken when making comparisons, cut across a number of subject areas. Rather than refer to these each time they arise these generic cases are described below.

1993 SNA – Standard definitions

Data included in this publication are compiled according to the 1993 SNA “System of National Accounts, 1993”; jointly prepared by the Commission of the European Communities, the International Monetary Fund, the Organisation for Economic Co-operation and Development, the United Nations and the World Bank.

2008 SNA – Changes from the 1993 SNA

The 2008 SNA has been finalised but it will be a number of years before most OECD countries are in a position to provide statistics on the basis of the new system. Key changes from the 1993 SNA are presented in the annex.

Questionnaires and source data

Unless otherwise specified all data have been provided by countries via standardised OECD questionnaires.

Statistical conventions

- All growth rates refer to constant prices (or real) data.
- Ratios, percentages and shares are derived from current prices data.
- Contribution of Y to the growth of X (Y being a component of X) is defined as the growth rate of Y (chained or fixed constant prices) weighted by the share of Y in X at current prices (period t-1).

Signs and abbreviations

...: Missing values, not applicable or not available.

e: OECD estimates.

|: Break.

Countries and zones

Data are available for most indicators for all OECD countries. Where data are not available or have not been provided to the OECD, estimates are often produced.

OECD total

OECD total refers to all OECD countries unless otherwise specified.

Euro area

Data for the zone “euro area” are taken from Eurostat databases.

Data in euros

Data for all member countries of the European Economic and Monetary Union (EMU) are expressed in euros.

Data relating to years prior to entry into the EMU have been converted from the former national currency using the appropriate irrevocable conversion rate. This presentation facilitates comparisons within a country over time and ensures that the historical evolution (i.e. growth rates) is preserved. However, pre-EMU euros are a notional unit and are not normally suitable to form area aggregates or to carry out cross-country comparisons.

OECD accession countries

In 2010, Chile (on 7 May), Slovenia (on 21 July), Israel (on 7 September) and Estonia (on 9 December), became members of the OECD. The Russian Federation is still in the process of accession. The OECD is also engaging key global players in its work, such as Brazil, China, India, Indonesia and South Africa. Although data for these countries do not currently form part of this publication, some national accounts data for them are available on the OECD website. See below for more information on how to find the data online.

General comments on concepts and comparability

The list of comments described below relates to cross-cutting issues and is provided here to avoid repetition in the sections that follow.

Purchasing power parities for GDP and for actual individual consumption

PPPs are the rates of currency conversion that equalise the purchasing power of different countries by eliminating differences in price levels between countries. When converted by means of PPPs, expenditures on GDP across countries are in effect expressed at the same set of prices, enabling comparisons between countries that reflect only differences in the volume of goods and services purchased. Simplistic comparisons of economic activity using exchange rates should generally be avoided as such comparisons will embody these price differences, and, moreover, exchange rate series tend to be more volatile than PPPs, presenting difficulties when comparing across countries and time.

However, a caveat related to international comparisons is still necessary in the context of PPPs. When countries are clustered around a very narrow range of outcomes, it may be misleading to establish a strict order of ranking. As is often the case with statistical information, there is a level of uncertainty associated with the data sources and procedures on which PPP computations rely. Relatively minor differences between two countries' PPP adjusted indicators, such as PPP adjusted GDP or NNI, may not be statistically or economically significant.

PPPs for GDP are used in all tables and graphs using PPPs as conversion rates except in the following tables and graph where PPPs for actual individual consumption are used: Table 6.1 (Household gross adjusted disposable income per capita), Figure 10.2 for household actual individual consumption, Table A.5 (Actual individual consumption, current PPPs) and Table A.6 (Actual individual consumption, 2005 constant PPPs).

1995-98: PPPs for all European countries are annual benchmark results provided by Eurostat. PPPs for all other countries are OECD estimates.

1999, 2002, 2005 and 2008: PPPs for all OECD countries except Chile are triennial benchmark results calculated jointly by the OECD and Eurostat.

2000-01, 2003-04, 2006-07, 2009-10: PPPs for all European countries are annual benchmark results provided by Eurostat. PPPs for all non-European countries are OECD estimates.

2011: PPPs for all European countries are preliminary annual benchmark results provided by Eurostat. PPPs for non-European countries are OECD estimates. Estimates and preliminary results should be interpreted with caution as they are subject to revision.

PPPs for Chile are estimates based on the results of the 2005 International Comparison Programme (ICP) round.

More information is available on the PPP Internet site: www.oecd.org/std/ppp.

Exchange rates

The exchange rates used in this publication have been calculated by the International Monetary Fund, and are published in *International Financial Statistics*. They are market rates averaged over the year.

Per capita indicators

Many of the indicators that follow are shown on a per capita basis. It is important to note therefore that the underlying population estimates are based on the SNA notion of residency: namely they include persons who are resident in a country for one year or more, regardless of their citizenship. This includes diplomatic personnel, defence personnel, together with their families located abroad, and students studying and patients seeking treatment abroad, even if they stay abroad for more than one year. The “one-year rule” means that usual residents who live abroad for less than one year are included in their “home country’s” population and foreign visitors (for example, holidaymakers) who are in the country for less than one year are not included.

An important point to note in this context is that individuals may feature as employees of one country (contributing to the GDP of that country via production), but residents of another (with their wages and salaries reflected in the GNI of their resident country).

Calendar/fiscal years

Unless specified below, or in the text accompanying the section, all data are on the basis of calendar years.

Data for Australia and New Zealand refer to fiscal years – 1 July of the year indicated to 30 June for Australia and 1 April of the year indicated to 31 March for New Zealand.

Volume (constant price) estimates

Most OECD countries now produce their accounts using annual chain volume series. Mexico however currently produces fixed-base volume estimates with the base year updated, at present, less periodically with links created to earlier base year estimates.

The SNA recommends the production of estimates on the basis of annual chain volume series. These produce better estimates of growth as the weights used for the contribution of different goods and services are more relevant to the period in question. There is one downside to (annual) chaining however: aggregates may not equal the sum of their components in volume terms.

Gross and net values

The term “gross” is a common means of referring to values before deducting consumption of fixed capital. But not all references to “net” are necessarily in the context of net of depreciation. The reference to “net lending/borrowing” is the relevant example in this publication where “net” is not in the context of “depreciation”.

Industrial classification (ISIC Rev. 4 and ISIC Rev. 3, International Standard Industrial Classification of All Economic Activities)

Previously the industrial classification was based on ISIC Rev. 3. Currently, the reference classification is ISIC Rev. 4.

Many countries provide now their series by activity according to ISIC Rev. 4 classification, whereas they used to provide them according to ISIC Rev. 3.

It is important to note that many countries have improved their sources in switching to the new classification (and therefore changed their totals). ISIC Rev. 3 won't be updated anymore for countries which have switched to ISIC Rev. 4. Most of non-EU countries are still providing their data according to ISIC Rev. 3. But the concerned countries are expected to change in the coming years to ISIC Rev. 4. Details of countries concerned are available in the comparability section.

The new ISIC Rev. 4 classification is broken down into 10 activities. The ISIC Rev. 3 is broken down in 6 activities. Therefore, categories have been gathered by the OECD for sake of presentation, as showed below, and one should keep in mind that they are not “equivalent”, though comparability has been kept as much as possible:

Rev. 4	Rev. 3
A	A – B
B – E	C – E
F	F
G – I + J	G – I
K + L + M – N	J – K
O – Q + R – U	L – P

These two ISIC classifications and their correspondence are available on UNSD website:

- <http://unstats.un.org/unsd/cr/registry/regcst.asp?Cl=2>.
- <http://unstats.un.org/unsd/cr/registry/regcst.asp?Cl=27>.

Households and NPISHs

A number of countries are not able to provide a breakdown of Households and Non-Profit Institutions Serving Households (NPISHs) in their sector accounts. As a consequence, to ensure the highest level of comparability, unless otherwise specified, the accounts for the households sector include NPISHs in this publication.

Important equalities in the SNA

Gross domestic product (GDP) at market prices

- = Final consumption expenditure
- + Gross capital formation
- + Exports of goods and services
- Imports of goods and services
- = Gross value added at basic prices
- + Taxes less subsidies on products

Net National Income (NNI) at market prices

- = GDP at market prices
- + Taxes less subsidies on production and imports (net, receivable from abroad)
- + Compensation of employees (net, receivable from abroad)
- + Property income (net, receivable from abroad)
- Consumption of fixed capital

Net National Disposable Income (NNDI)

- = NNI at market prices
- + Current taxes on income, wealth, etc. (net, receivable from abroad)
- + Social contributions and benefits and other current transfers (net, receivable from abroad)

Saving, net

- = NNDI at market prices
- Final consumption expenditure
- + Adjustment for the change in net equity of households on pension entitlements (net, receivable from abroad)

Net lending/net borrowing

- = Saving, net
- + Capital transfers (net, receivable from abroad)
- Gross capital formation
- Acquisitions less disposals of non-produced non-financial assets
- + Consumption of fixed capital

Further reading

Useful references for “further reading” are available at the bottom of most sections.

For all sections, general information on methodology and detailed definitions can be found in:

- UN, OECD, IMF, World Bank and Eurostat (eds.) (1993 and 2008), *System of National Accounts 1993*, United Nations, Geneva, <http://unstats.un.org/unsd/sna1993>. *System of National Accounts 2008*, United Nations, Geneva, <http://unstats.un.org/unsd/nationalaccount/sna2008.asp>.

Extracts of the SNA publication are available in:

- OECD (2000), *System of National Accounts, 1993 – Glossary*, OECD Publishing, Paris, <http://dx.doi.org/10.1787/9789264180871-en>.

Finally, additional information and complementary tables can be found in:

- OECD (2012), *OECD Factbook 2011-2012: Economic, Environmental and Social Statistics*, OECD Publishing, Paris, <http://dx.doi.org/10.1787/factbook-2011-en>.

Online data

National Accounts at a Glance – Database edition

The database edition of *National Accounts at a Glance* is continuously updated on line and contains longer time series than the publication: <http://dx.doi.org/10.1787/data-00369-en>. Data are available as far back as 1970 for some countries.

An inventory of the series published in *National Accounts at a Glance* is available on line. The inventory includes the titles of the individual time series along with the corresponding database codes. This inventory may be accessed via: www.oecd.org/statistics/nationalaccounts/ata glance.

Detailed National Accounts data

The *National Accounts at a Glance* dataset is published as part of the OECD *National Accounts Statistics* online database which can be accessed via <http://dx.doi.org/10.1787/na-data-en>. This database includes very detailed information from the annual national accounts as well as financial and general government accounts, mainly of which are also available on a quarterly basis.

The following is a list of the datasets which are available:

Aggregate national accounts

- Gross domestic product.
- Disposable income and net lending/borrowing.
- Population and employment by main activity.
- PPPs and exchange rates.

Detailed national accounts

- Balance sheets for non-financial assets.
- Capital formation by activity.
- Final consumption expenditure of households.
- Fixed assets by activity and by type of product.
- Labour input by activity.
- Non-financial accounts by sectors.
- Simplified non-financial accounts.
- Value added and its components by activity.

Financial accounts

- Consolidated financial accounts (flows).
- Non-consolidated financial accounts (flows).
- Consolidated financial balance sheets (stocks).
- Non-consolidated financial balance sheets (stocks).

General government accounts

- Government expenditure by function.
- Maastricht debt.
- Main aggregates.
- Taxes and social contributions receipts.

Website

OECD National Accounts, www.oecd.org/std/national-accounts.

GROSS DOMESTIC PRODUCT (GDP)

1. Size of GDP
2. GDP growth
3. GDP per capita

1. Size of GDP

Gross Domestic Product (GDP) is the standard measure of the value of final goods and services produced by a country during a period. While GDP is the single most important indicator to capture these economic activities, it is not a good measure of societies' well-being and only a limited measure of people's material living standards. The sections and indicators that follow better address this and other related issues and this is one of the primary purposes of this publication.

Countries calculate GDP in their own currencies. In order to compare across countries these estimates have to be converted into a common currency. Often the conversion is made using current exchange rates but these can give a misleading comparison of the true volumes of final goods and services in GDP. A better approach is to use purchasing power parities (PPPs). PPPs are currency converters that control for differences in the price levels of products between countries and so allow an international comparison of the volumes of GDP and of the size of economies.

Definition

What does gross domestic product mean? "Gross" signifies that no deduction has been made for the depreciation of machinery, buildings and other capital products used in production. "Domestic" means that it is production by the resident institutional units of the country. The products refer to final goods and services, that is, those that are purchased, imputed or otherwise, as: final consumption of households, non-profit institutions serving households and government; fixed assets; and exports (minus imports).

GDP at market prices can be measured in three different ways:

- as output less intermediate consumption (i.e. value added) plus taxes on products (such as VAT) less subsidies on products;
- as the income earned from production, equal to the sum of: employee compensation; the gross operating surplus of enterprises and government; the gross mixed income of unincorporated enterprises; and net taxes on production and imports (VAT, payroll tax, import duties, etc., less subsidies);
- or as the expenditure on final goods and services minus imports: final consumption expenditures, gross capital formation, and exports less imports.

Comparability

Comparability is good but in some countries, for example in specific areas such as the own account production of software or financial intermediation services (indirectly measured) (FISIM), differences remain, which can impact on comparisons of GDP. The measurement of the non-observed economy (NOE, often referred to as the informal, grey, shadow, economy) can also have an impact on comparability, although for OECD economies, in general, this is not thought to be significant. (See also "Reader's guide", relating to PPP based comparisons.)

For some countries, the latest year has been estimated by the Secretariat. Historical data have also been estimated for those countries that revise their methodologies but only supply revised data for some years. This estimation process mechanically links the new and old series to preserve growth rates.

2. GDP growth

Changes in the size of economies are usually measured by changes in the volume (often referred to as real) levels of GDP. Real reflects the fact that changes in GDP due to inflation are removed. This provides a measure of changes in the volume of production of an economy.

Definition

Converting nominal values of GDP to real values requires a set of detailed price indices, implicit or directly collected. When applied to the nominal value of transactions, the corresponding volume changes can be captured. The detailed volume changes for goods and services – typically several hundred – are then aggregated to yield an overall change in the volume of GDP. In the past, most countries used fixed weights for this aggregation and the base year to which weights related was only modified every five to ten years. It is important to recognise that growth rates are not invariant to the choice of this reference period and measures of growth could turn out to be biased for reporting years that were remote from the base year.

Since the 1993 *System of National Accounts* it has therefore been recommended that weights should be representative of the periods for which growth rates are calculated. This means that new weights should be introduced every year, giving rise to chain-linked (volume) indices (see *Comparability*, below).

Comparability

As described in Section 1, comparability of nominal values of GDP across countries is good. There is generally some

variability in how countries calculate their volume estimates of GDP, particularly in respect of government consumption, but this doesn't necessarily mean that growth rates are less comparable.

With the exception of Mexico, all OECD countries derive their annual estimates of real GDP using annually chain-linked volume indices (that is the weights are updated every year). Mexico like many non-OECD countries, revises their weights less frequently. Such practices however tend to lead to biased growth rates, usually upward.

3. GDP per capita

Gross Domestic Product (GDP) per capita is a core indicator of economic performance and commonly used as a broad measure of average living standards or economic well-being; despite some recognised shortcomings.

For example average GDP per capita gives no indication of how GDP is distributed between citizens. Average GDP per capita may rise for example but more people may be worse off if income inequalities also increase.

Equally, in some countries (see Comparability), there may be a significant number of non-resident border or seasonal workers or indeed inflows and outflows of property income and both phenomena imply that the value of production differs from the income of residents, thereby over or understating their living standards.

A full discussion of these issues can be found in the Stiglitz-Sen-Fitoussi report (see “Further reading”).

Definition

The definition for GDP is described in Section 1 and population estimates are described in the “Reader’s guide”.

A focus on per capita GDP is also useful in decomposing drivers of overall GDP growth. For example real GDP can grow without there being any improvement in real GDP per capita. Decomposing per capita growth into two parts, labour productivity growth (measured as GDP per hour worked) and labour utilisation growth (measured as hours worked per capita) is helpful in this context.

Comparability

The comparability of population and GDP estimates across countries is good (see Section 1). However, some care is

needed in interpretation, for example Luxembourg and, to a lesser extent, Switzerland have a relatively large number of frontier workers. Such workers contribute to GDP but are excluded from the population figures, which is one of the reasons why cross-country comparisons of income per capita based on gross or net national income (GDI and NNI) are often preferred, see second chapter on Income. (See also “Reader’s guide”, relating to PPP based comparisons.)

INCOME

4. National income
5. Real measures of income
6. Disposable income
7. Saving
8. Household saving rate
9. Net lending/net borrowing

4. National income

While per capita gross domestic product is the indicator most commonly used to compare income levels, two other measures are preferred, at least in theory, by many analysts. These are per capita Gross National Income (GNI) and Net National Income (NNI).

Definition

GNI is defined as GDP plus net receipts from abroad of wages and salaries and of property income plus net taxes and subsidies receivable from abroad. NNI is equal to GNI net of depreciation.

Wages and salaries from abroad are those that are earned by residents who essentially live and consume inside the economic territory but work abroad (this happens in border areas on a regular basis) or for persons that live and work abroad for only short periods (seasonal workers) and whose centre of economic interest remains in their home country. Guest-workers and other migrant workers who live abroad for twelve months or more are considered to be resident in the country where they are working. Such persons may send part of their earnings to relatives at home, but these remittances are treated as transfers between resident and non-resident households and are recorded in national disposable income (Section 6) but not national income.

Property income from abroad includes interest, dividends and all or part of the retained earnings of foreign enterprises owned fully or in part by residents. In most countries, net receipts of property income account for most of the difference between GDP and GNI.

Note that retained earnings of foreign enterprises owned by residents may not actually return to the residents concerned, and, in some countries, there are restrictions on the repatriation of profits. Receipt of retained earnings is

an imputation, and, since there is no actual transaction, it is necessary to impute an outflow of the same amount. The imputed outflow is treated as a financial transaction (a reinvestment of earnings abroad) and not as an outflow of property income. Countries with large stocks of outward foreign direct investment may be shown as having large receipts of property income from abroad and therefore high GNI even though much of the property income may never actually be returned to the country but instead added to foreign direct investment.

Comparability

Comparability is good but there are practical difficulties in the measurement both of international flows of wages and salaries and property income and of depreciation. It is for that reason that GDP per capita is the most widely used indicator of income or welfare, even though it is theoretically inferior, in that context, to either GNI or NNI.

5. Real measures of income

As described in earlier sections, measures of income, such as national or disposable income are generally preferred, in theory, to GDP, in analyses of well-being both in nominal and real terms. However there are some specificities related to the calculation and associated interpretations of real income, as opposed to real GDP say, that are worth mentioning.

Definition

Whereas GDP can be measured relatively simply in volume terms because price and quantity components exist, at least in principle, for all of the flows in GDP (via the expenditure or production approach), this is not the case for the additional income components that reflect the difference between GNI say and GDP; which cannot be decomposed into price and quantity dimensions. These flows can be measured in “real” terms through the use of an appropriate price index that measures their real purchasing power in relation to a selected basket of goods and services. But moving from real GDP to real GNI is not simply a case of choosing an appropriate price index to deflate the additional income components. Another adjustment that takes account of changes in the *terms of trade* is needed; which is only relevant for real measures.

Gross Domestic Income (GDI), as opposed to Gross National Income, in current prices is exactly equal to GDP. But if the prices of a country’s exports rise faster (or fall more slowly) than the prices of its imports (that is, if its terms of trade improve) fewer exports are needed to pay for a given volume of imports. Thus, an improvement in the terms of trade makes it possible for an increased volume of goods and services to be purchased by residents out of the incomes generated by a given level of domestic production. This improvement (or otherwise, *e.g.* if the prices of imports rise faster than exports), known as *trading gains and losses from changes in the terms of trade*, reflects the difference between real GDI and real GDP. It follows that it also forms part of the difference between real GDP and real national income (GNI and NNI) and disposable (and adjusted disposable) income.

These trading gains or losses are equal to the current trade balance deflated by a single price index, minus real exports, plus real imports (where estimates of real exports and real imports are consistent with those used in real GDP). And so

real GDI is equal to final consumption (households, NPISH and general government final consumption) + real gross capital formation + the “real” trade balance.

Comparability

The comparability of current price measures of income is described in the previous sections. The choice of the single price index used to deflate the current trade balance varies across countries. The SNA recommends that the choice of the price index is left to statistical authorities to decide on the basis of national circumstances. Three approaches are commonly used. The first is to use either the overall import (or export) price index. The second is to use a weighted average of the overall import and export price indices. The third method, which is the approach used by many countries for simplicity, is a general price index (typically this is the implied deflator for gross domestic final expenditure). The advantage of this third approach is that the income components that reflect the difference between GNI (and other income measures) and GDP can also be (and usually are) meaningfully deflated using this same general price index.

6. Disposable income

Disposable income, as a concept, is closer to the concept of income generally understood in economics, than either national income or GDP. At the total economy level it differs from national income in that additional income items are included, mainly *other current transfers* such as *remittances*. For countries where these additional items form significant sources of income the importance of focusing on disposable income in formulating policy is clear. For OECD countries the differences between national and disposable income at the total economy level are typically insignificant. But another very important difference between national income and disposable income concerns the allocation of income across sectors. At this level significant differences arise. In the main these reflect the reallocation of national income: *from corporations and households to government*, on account of income taxes; *from households to government* to reflect social contributions; and, *from government and corporations to households* to reflect social benefits other than social transfers in kind. It is mainly this reallocation of income that brings the concept of income closer to the economic concept. Indeed, ignoring, for simplicity, changes in net worth that arise from capital transfers or holding gains say, disposable income can be seen as the maximum amount that a unit can afford to spend on consumption goods or services without having to reduce its financial or non-financial assets or by increasing its liabilities.

Definition

The description given above relates to what is known as *disposable income*, which can be shown gross or net of depreciation. However there is an important variant of this concept, described as *adjusted disposable income*, which additionally reallocates “income” from government and NPISHs to households to reflect social transfers in kind. These transfers reflect expenditures made by government or NPISHs on individual goods and services, such as health and education, on behalf of an individual household.

This variant provides an important mechanism for international comparisons of households’ “income” as it adjusts for the levels of individual goods and services indirectly “consumed” by households via taxation for example. The adjustment in effect imputes these expenditures from government/NPISHs to households (*actual consumption*) and also imputes the same values to households as if they were income (meaning that *net saving* is unaffected by this reallocation, see Section 7). In theory some social transfers in kind may involve non-resident households or

governments/NPISH but these are typically insignificant and, so, the SNA recommends, unless strong evidence to the contrary exists, that these cross border flows net out.

Comparability

Comparability is good but there are practical difficulties in the measurement of the additional income components, such as remittances, that make up the difference between GDP and disposable income (including adjusted). It is for that reason that GDP per capita is the most widely used indicator of income or welfare, even though it is theoretically inferior, in that context, to measures of disposable income.

Both measures of disposable income include the payments of pension contributions to pension schemes and to social security and the receipts of pensions from pension schemes and social security. The SNA prescribes this treatment as it aligns better with the individual’s concept of income and comes despite the fact that payments of pension contributions into the schemes and the receipts of pensions by pensioners constitute the acquisition and disposal of financial assets (see also Section 7). Not all countries however include these particular flows into and out of pension schemes as parts of disposable income and so comparability at the sectoral level is affected, albeit only marginally.

Table 6.2 shows annual growth in household net disposable income in real terms (with nominal values deflated by the total household final consumption deflator). Table 6.3 shows annual growth in households net adjusted disposable income in real terms (with nominal values deflated by the actual individual consumption deflator).

7. Saving

The purpose of saving is to increase future resources available for consumption and to protect against unexpected changes in income. Saving in its simplest terms is very similar to the concept of saving commonly used by the man on the street. It reflects the amount of disposable income that remains after final consumption expenditures, and that is invested – be that in financial assets, such as bank deposits or shares, or non-financial assets, such as real estate. Its importance is therefore paramount in many areas such as: analyses of the sustainability of consumption patterns; or the scope of governments to stimulate demand or raise taxes. Government saving is also an important indicator in a budgetary context. The “Golden rule”, for example, that government saving should be zero over the course of an economic cycle is often set as a fiscal objective.

Definition

Saving is the difference between disposable income and final consumption expenditure plus the change in net equity of households in pension funds (since this component is also a determinant of household disposable income but with an opposite sign, see also Section 6). It can also be calculated using adjusted disposable income and actual final consumption instead of disposable income and final consumption. It therefore reflects the residual income used to acquire financial and non-financial assets. Net saving is equal to saving net of depreciation.

Because by definition they have no final consumption, saving and disposable income are exactly equal for corporations.

It's important to note that disposable income does not include any capital gains or indeed losses, and, so, neither does saving. Some have argued that disposable income and saving should include capital gains. But asset prices may rise for reasons unconnected with the productive potential of the economy, for example, a reduction of the risk premium. Moreover capital gains have to be realised before they are available to support consumption, and the very act of realising gains may actually reduce their size. Finally households respond differently to capital gains than to income. This is partly because asset prices are volatile, and partly because much household wealth is not liquid (e.g. pension funds).

An interesting point to note in this context is the treatment of capital gains taxes, which are included in disposable income. Taken to an extreme, for households this means that savings will fall, everything else being equal, during periods of strong asset prices because of the taxes payable on capital gains realised.

Comparability

Because disposable income and final consumption expenditure are large aggregates, small changes to either are capable of producing a large change in gross saving. Although in itself this does not impair international comparability it does mean that some care is needed in interpreting early estimates of saving's statistics, which may be affected by revisions.

As described in Section 6 not all countries include changes in net equity of households in pension funds and so comparisons of savings estimates at the sectoral, but not national, level will be affected.

Some care is also needed in terms of economic interpretability at the sectoral level. For example, because in many countries capital gains taxes are lower than marginal income taxes, instead of paying a dividend, a company may choose to buy its own equity at a premium, so rewarding its shareholders with a capital gain. This would result in lower estimates of households savings than if dividends were paid, as dividends are recorded as disposable income.

8. Household saving rate

Household saving is the main domestic source of funds to finance capital investment, which is a major impetus for long-term economic growth. Household saving rates vary considerably between countries because of institutional, demographic and socio-economic differences. For example government provisions for old-age pensions and the demographic age structure of the population will all influence the rate at which populations save (older persons tend to run down their financial assets during their retirement to the detriment of saving). Equally the availability and price of credit, as well as attitudes towards debt, may also influence choices made by individuals regarding whether to spend or save.

Definition

In the national accounts, household saving is estimated by subtracting household consumption expenditure from household disposable income plus the change in net equity of households in pension funds (since this component is also a determinant of household disposable income but with an opposite sign).

Household disposable income consists essentially of income from employment and from the operation of unincorporated enterprises, plus receipts of interest, dividends and social benefits minus payments of current taxes, interest and social contributions. Note that enterprise income includes imputed rents “paid” by owner-occupiers of dwellings.

Household consumption expenditure consists mainly of cash outlays for consumer goods and services but it also includes the imputed expenditures that owner occupiers pay, as occupiers, to themselves as owners of their dwellings and the production of goods for own-final use such as agricultural products – the values of which are also included in income.

The household saving rate is calculated as the ratio of household saving (plus the change in net equity of households in pension funds) to household disposable income.

Comparability

Saving rates may be measured on either a net or a gross basis. Net saving rates are measured after deducting consumption of fixed capital (in respect of assets used in unincorporated enterprises and in respect of owner-occupied dwellings), from saving and from the disposable income of households, so that both saving and disposable income are shown on a net basis.

Most countries publish ratios on a net basis. However some countries publish these ratios on a gross basis; which causes an upward bias compared to net ratios: (as saving is always less than disposable income, and depreciation is unlikely to ever be larger than disposable income).

9. Net lending/net borrowing

Net lending/borrowing is one of only two balancing items in the SNA where the reference to “net” is not in juxtaposition to “gross”: in other words it is not in reference to lending net of depreciation. If it is positive it is described as net lending and if negative, as net borrowing. It reflects the amount of financial assets that are available for lending or needed for borrowing to finance all expenditures – consumption expenditure, gross capital formation and capital transfers – in excess of disposable income. Its importance as an economic concept is best illustrated by the fact that it forms one of the two Maastricht excessive deficit criteria (with an additional adjustment to reflect net streams of interest payments resulting from swaps arrangements and forward rate agreements) used by the European Commission to assess the soundness and sustainability of public finances.

Definition

Net lending or borrowing can be measured identically as the balancing item in either the capital or financial accounts.

It can therefore be derived as saving less acquisitions plus disposals of non-financial assets plus capital transfers receivable minus capital transfers payable.

Or it can be derived as the difference between net acquisition of financial assets and net incurrence of liabilities. Financial assets (and liabilities) include: Monetary gold, Special Drawing Rights, Currency and Deposits, Securities, Shares and other equity, Insurance Technical Reserves (including net equity of households in pension funds, see Sections 6, 7 and 8) and Other accounts receivable and payable (such as trade credits and advances for work in progress or to be undertaken).

Although it can be derived via either approach it is important to note that, in practice, achieving this equivalence is one of the most difficult tasks in compiling national accounts.

Another important point worth making in this context concerns contingencies. Many types of contractual financial arrangements do not give rise to unconditional requirements either to make payments or to provide other objects of value. These “contingencies” are not recorded as financial

assets in the SNA. If an event occurs (and a feature of contingencies is that they may not), for example, transactions in financial assets related to the realisation of the contingency, the transactions are recorded in the accounts in the usual way. A simple example of a contingency is an overdraft facility on a bank account. The existence of the facility does not of itself create a financial asset (of the bank) and liability (of the account holder). But any borrowing that subsequently occurs in relation to the facility will.

Comparability

Generally the comparability of statistics on net lending and net borrowing is good, especially for EU countries. That said, the difficulty that many countries face in reconciling the two approaches to measurement gives some indication of the care needed. Comparability, or rather the care needed when interpreting cross-country data, is perhaps a bigger issue at the sectoral level. Again, this is not fundamentally a question of conceptual differences but real differences in the types of institutions included within institutional sectors: for example in some countries hospitals are outside of the general government sector – see also Section 16.

In Ireland, in 2010, the government made massive capital transfers to Anglo Irish Bank, Irish Nationwide Building Society and EBS Building Society, which had a big impact on the government net lending figures.

EXPENDITURE

- 10. Household consumption
- 11. General government final consumption
- 12. Investment
- 13. Exports and imports of goods and services

10. Household consumption

Household final consumption expenditure is typically the largest component of final uses of GDP, representing in general around 60% of GDP. It is therefore an essential variable for economic analysis of demand. An additional concept, (household) actual individual consumption, also exists in the SNA. This concept allocates individual consumption expenditures of general government and NPISHs (those that directly benefit households) to households (the ultimate consumers of these expenditures), providing an important measure for cross-country comparisons, in particular for comparisons of well-being.

Definition

Household final consumption expenditure covers all purchases made by resident households (home or abroad) to meet their everyday needs: food, clothing, housing services (rents), energy, transport, durable goods (notably cars), spending on health, on leisure and on miscellaneous services.

It also includes a number of imputed expenditures, for example agricultural products produced for own-consumption but the most significant imputation is typically owner-occupiers' imputed rents. The other main imputed item of expenditure relates to income in kind (employees may receive goods and services either free of charge or at very low prices as part of their wages).

By convention, apart from dwellings, all goods and services bought by households to meet their own everyday needs are recorded as final consumption. Purchases of dwellings are recorded as gross fixed capital formation. Partial payments for goods and services "provided" by general government are included in household final consumption. This covers cases in which households have to pay a part of the public services provided, for example prescription medicines and medical services partly reimbursed by government. The portion that is reimbursed forms part of expenditure by general government, and, so, also, of household actual individual consumption.

Households' actual individual consumption is equal to households' consumption expenditure plus those (individual) expenditures of general government and NPISHs that directly benefit households, such as, health care and education. See also Section 6 on disposable income.

Comparability

Comparability of both concepts (household final consumption and household actual individual consumption) is good. However, cross-country comparisons of actual individual consumption provide a better basis to measure relative well-being of households across countries. This is because there are significant differences between countries regarding the proportion of expenditure on health care and education paid directly by households and the proportion paid on their behalf by government, which are financed for example through taxes and that do not form part of household final consumption.

Figure 10.2 shows actual individual consumption per head using PPPs specifically related to actual individual consumption and are therefore different to those used for overall GDP.

Table 10.3 and Figure 10.3 show the contribution made by household final consumption (and other components of final demand and imports) to overall GDP growth. Note that for those countries that deflate their current price estimates of GDP using so-called superlative price indices, such as the United States, the sum of the contribution of the individual components will not necessarily sum to the overall GDP growth rate.

11. General government final consumption

General government final consumption expenditure consists of expenditure incurred by government in its production of non-market final goods and services (except GFCF) and market goods and services provided as social transfers in kind. Total general government final consumption is perhaps of less political relevance, from a fiscal perspective, than general government expenditure (see Section 16) but its importance as a component of total GDP, and, so, as a reflection of its direct role as a “consumer” of final goods and services is significant.

Definition

General government final consumption can be broken down into two distinct groups.

The first reflects expenditures for collective consumption (defence, justice, etc.) which benefit society as a whole, or large parts of society, and are often known as public goods and services.

The second reflects expenditures for individual consumption (health care, housing, education, etc.), that reflect expenditures incurred by government on behalf of an individual household (see also Section 10). This category of expenditure is equal to social transfers in kind from government to households (see Section 6) and so includes expenditure by government on market goods and services provided to households.

As goods and services produced by government usually do not have a market price, the relevant products are valued at the sum of costs needed to produce these goods and services. These costs mainly consist of compensation of employees, intermediate consumption and depreciation. Final consumption of government can then be estimated as the difference between on the one hand government output, and on the other hand payments made for goods and services produced by government and the relevant output that is used for fixed capital formation.

The borderline between individual and collective consumption is in some cases not completely clear. For example, expenditures incurred by Ministries of Health and

Education at a national level are included in collective services, reflecting their role as producers of policy, standards and regulation. But expenditures on the administration or functioning of a group of hospitals say are recorded as individual. To assist in this delineation the SNA provides guidance based on the Classification of the Functions of Government (COFOG) see also section 17. It states that all government final consumption expenditures under the following headings (*Health, Recreational and sporting services, Cultural services, Education and social protection*) should be treated as expenditures on individual services except for expenditures on general administration, regulation, research, etc.

Comparability

The comparability of general government final consumption across countries is high. However interpretations of comparisons of general government final consumption across countries are enhanced when breakdowns between individual and collective consumption are provided (see also Section 6).

12. Investment

Investment, or to be more precise, gross fixed capital formation, is an essential variable in economic analyses, such as analyses of demand and productivity.

Definition

Gross fixed capital formation (GFCF) is defined in the national accounts as acquisition less disposals of produced fixed assets, i.e. assets intended for use in the production of other goods and services for a period of more than a year.

Acquisition includes both purchases of assets (new or second-hand) and the construction of assets by producers for their own use.

The term *produced assets* signifies that only those assets produced as a result of a production process recognised in the national accounts are included. The national accounts also record transactions in non-produced assets such as land, oil and mineral reserves for example; which are recorded separately as purchases of non-produced assets and not as GFCF.

Acquisition prices of capital goods include transport and installation charges, as well as all specific taxes associated with purchase.

GFCF can be broken down into particular asset groups. Table 12.2 contains 6 groups: dwellings (excluding land); other buildings and structures (roads, bridges, airfields, dams, etc.); transport equipment (ships, railway, aircraft, etc.); other machinery and equipment (office machinery and hardware, etc.); cultivated assets (managed forests, livestock raised for milk production, etc.) and intangible fixed assets (intellectual property type fixed assets such as mineral exploration, software and databases, and literary and artistic originals, etc.).

An additional important grouping of Information and Communication Technology (ICT) products is shown in Figure 12.2. ICT has three components: office machinery and hardware (computers and related hardware); radio, TV and communication (mainly communications equipment); and computer software. It is important to note that ICT embodied in non ICT assets is not included in this concept.

GFCF can also be broken down into institutional sectors. For government this typically means investment in transport infrastructure and public buildings such as schools and hospitals.

For households, GFCF generally equates to dwellings, although investments made by unincorporated enterprises in other products do occur as well.

Comparability

When the *System of National Accounts* was revised in 1993, the scope of GFCF was widened to include mineral

exploration, computer software and entertainment, literary and artistic originals. Comparability of these items has improved in recent years but the scope with which the various items are covered is smaller in some countries, particularly in the case of own-account production of software.

In making comparisons of GFCF by institutional sector, attention should be given to the mechanisms commonly used to “acquire” assets. For example a unit may prefer to rent an asset, which will not count as GFCF of the lessee. If however the agreement between the lessee and the lessor resembles a finance lease, the SNA treats the lessee as having acquired the asset. On a larger scale many governments are increasingly turning to private finance initiatives to create public infrastructure. Determining who the owner of these schemes is in an SNA sense is non-trivial and may cause problems for temporal and international comparability.

The scope of assets has been widened in the 2008 SNA to include Research and Experimental Development and military weapons systems (see Annex B for further information) but the figures contained here do not reflect these additions (except for Australia which follows the 2008 *System of National Accounts*).

Note on Table 12.2: “Dwellings” includes “Other buildings and structures” for Chile, Norway, Portugal and Turkey. It also includes “Cultivated assets” for Chile. “Cultivated assets” are not capitalised for Canada and USA. “Cultivated assets” is included in “Other machinery and equipment” for United Kingdom. “Transport equipment” is included in “Other machinery and equipment” for Chile and Turkey. “Ownership transfer costs” are included in the total assets but not in the breakdown for Australia.

13. Exports and imports of goods and services

In today's increasingly globalised world, exports and imports are key aggregates in the analysis of a country's economic situation. Whenever the world economy slows down or accelerates, the national economy is potentially affected.

Definition

Exports of goods and services consist of sales, of goods and services (included in the production boundary of GDP) from residents to non-residents. These also include transactions in barter or goods exported as part of gifts or grants. Equally, imports reflect the same transactions from non-residents to residents.

A unit is said to be resident in a country when its "centre of economic interest" is situated in that country's economic territory. A country's economic territory is the geographic area corresponding to the nation state. It includes its air space, its territorial waters, its territorial enclaves in the rest of the world (embassies in foreign countries) and free zones. Conversely, it excludes foreign embassies located in the country.

Not all goods need to physically enter a country's border to be recorded as an export or import. Transportation equipment, goods produced by residents in international waters sold directly to non-residents, and food consumed in ships or planes are but a few examples of transactions which may be recorded as exports or imports without physically crossing borders.

Equally not all goods that enter a country's borders are necessarily imports or exports. Transportation equipment, goods sent abroad for minor processing (or which enter and leave a country in their original state and ownership) are examples of goods that cross borders but are not recorded as imports or exports.

A number of indicators can be derived from exports and imports of goods and services. For example the degree of openness (export + imports)/GDP (Tables 13.3 and 13.4) or the terms of trade (Table 13.5). The terms of trade are defined as the ratio between the index of export prices and the index of import prices.

Comparability

Goods (merchandise trade) reflect the bulk of import and exports, and these are generally well covered and afford good comparability across countries; although discrepancies between total imports and exports of traded goods at the global level reveal that measurement in practice is not trivial. Growth in trade through the Internet has increased measurement difficulties.

The comparability of trade in services is greater affected by practical measurement issues however; even if the conceptual approach, as it is for goods, is the same for all OECD countries.

Until recently, exports and imports of services mainly consisted of transport services (sea, air) and insurance. But increases in outsourcing, merchanting, processing services (see also Annex B for changes implied by the 2008 SNA) and transactions in intellectual property, such as software and artistic originals, have increased the difficulties inherent in the measurement of trade in services. Some payments, for example in software, are incorrectly recorded as property income say and not in the goods and services accounts.

PRODUCTION

- 14. Value added
- 15. Compensation of employees

14. Value added

Value added reflects the contribution of labour and capital to production. It can be shown by type of activity, by type of product, by institutional sector, etc. Value added is a key variable in economic analyses such as productivity and structural analysis.

Definition

Value added at basic prices can be simply defined as the difference between gross output (at basic prices) and intermediate consumption (at purchasers prices) and can be decomposed into the following components: compensation of employees; gross operating surplus; mixed income; and other taxes on production less subsidies on production. It can also be derived as the difference between GDP (at market prices) and taxes on products less subsidies on products.

The SNA recommends the basic price valuation for value added but it can also be measured on different price bases such as producers prices and at factor cost.

One of the major advantages of value added is that it avoids problems inherent in the measurement of output which is a gross concept – gross in the sense that it counts the output of all production units whether or not the output is used in the domestic production of other goods and services. Countries with fragmented production networks therefore will have, all other things equal, higher output than those with more consolidated networks, complicating international comparisons. This can also be a temporal problem as production networks can become more or less consolidated (through outsourcing for example) within a country from one year to another. Indeed production networks have become increasingly globalised in recent years, further affecting temporal and cross-country comparability.

Value added avoids these problems by measuring the *value* that a resident unit *adds* to that of the units that supply its inputs.

Like its GDP counterpart, value added can also be measured on a net basis, where the “net” refers to net of depreciation.

Like its nominal counterpart, real value added can be derived as the difference between real output and real intermediate consumption, an approach known as double-deflation.

A useful additional comment worth making in the context of value added concerns non-market output. By convention, because market prices are not observable, non-market

output is calculated on a sum of costs approach with gross operating surplus set equal to depreciation only and no net return to capital imputed.

Comparability

Not all countries produce value added on the basis of basic prices. *Japan* uses approximately market prices. *New Zealand* uses producer prices, and *Iceland* and the *USA* use factor costs.

The tables and figures showing breakdowns by activity are based on the recently revised classification system (ISIC Rev. 4). Countries generally collect information using their own industrial classification systems. The conversion from a national classification system to ISIC may create some comparability issues. For example, for *Japan*, Hotels (which form approximately 3.0% of value added) are included in Other services not wholesale, retail, etc. That said, at the 6 “recomposed” activity level presented here, for most countries the sectors are generally comparable. The following countries report their data using the ISIC Rev. 3 classification: *Canada*, *Israel*, *Japan*, *Mexico*, *New Zealand*, *Turkey* and *USA*. For more information see reader’s guide “industrial classification”.

15. Compensation of employees

Compensation of employees reflects the total remuneration in cash or in kind paid to employees and comprises wages and salaries and the value of social contributions paid by employers. They typically form the largest part of value added. Combined with estimates of labour input they provide the basis for a number of important statistics including unit labour costs and average earnings; which play an important role in many countries in monetary policy and cross country comparisons of labour costs.

Definition

Compensation of employees is made up of two components:

- *Wages and salaries payable in cash or in kind:* These include the values of any social contributions, income taxes, etc., payable by the employee even if they are actually withheld by the employer and paid on behalf of the employee.
- *The value of social contributions payable by employers:* These may be the actual social contributions payable by employers to social security schemes or to private funded social insurance schemes to secure social benefits for their employees; or imputed social contributions by employers providing social benefits through unfunded schemes.

Compensation of employees is not payable in respect of unpaid work undertaken voluntarily, including the work done by members of a household within an unincorporated enterprise owned by the same household. Compensation of employees excludes any taxes payable by the employer on the wage and salary bill (e.g. payroll tax, fringe benefits tax).

It's important to note that compensation of employees does not represent the entire costs of labour within production. Mixed income, which reflects the income paid to the owner(s) or members of the same household who contribute unpaid labour inputs in unincorporated enterprises owned by households, also contains a labour component.

Comparability

Comparability is generally very good across all countries. The presented tables and figures showing breakdowns by activities are re-based on the recently revised classification system (ISIC Rev. 4). However, the following countries report their data according to ISIC Rev. 3: Canada, Israel, Japan, Mexico, New Zealand, Turkey and USA. For more information see reader's guide "industrial classification". Some care should be taken in interpreting labour costs by activity however, especially in a cross-country context. In some countries, and notably in some sectors, the shares of self-employed in the labour force may be significant and, so, differences in the shares of compensation of employees across countries may reflect institutional differences, for example tax incentives to be self-employed or otherwise. This can also have implications in a temporal context. For example systematic declines in the contribution of compensation of employees to value added may reflect a move by individuals to become self-employed rather than a decline in the share of labour overall; this can be both through push and pull mechanisms. For example squeezes on wages and salaries and social benefits (push) or tax incentives (pull).

19. Social contributions
20. Social benefits
21. Gross saving and net lending/net borrowing
22. Financial assets and liabilities

16. Total expenditure

Section 11 described the concept of general government final consumption, reflecting the contribution government makes as a consumer of final goods and services for individual and collective consumption. Whilst useful in illustrating the scope for government to stimulate demand directly, it does not tell the full story. For a start the measure does not include gross fixed capital formation of government which is an area where the scope to stimulate demand is considerable. But it also excludes other components of spending by government not recorded as final consumption, for example, debt interest payments, and cash transfers, such as social benefits, which, collectively, better reflect the size of government and its ability to stimulate demand, without changing taxes say, both directly and indirectly. The concept that best reflects this overall expenditure is referred to as *general government expenditure*. It reflects the total amount of expenditure by government that needs to be financed via revenues, such as taxation, and borrowing.

Definition

Total general government expenditure (GGE) is equivalent to expenditures by general government on the following items: intermediate consumption, compensation of employees, subsidies, social benefits and social transfers in kind (via market producers), other current transfers, property income, capital transfers (payable), the adjustment for the net equity of households in pension funds reserves, gross capital formation and net acquisition of non-financial non-produced assets. It also includes taxes on income and wealth and any other taxes on production that government may be required to pay.

Many of the transactions are better recorded on a consolidated basis (i.e. transactions between general government sub-sectors are netted out) to avoid exaggerating the role of general government. Items that are usually consolidated include: debt interest (part of property income), and capital transfers (except capital taxes payable) and other current transfers.

The government sector covers all units producing (all or mostly) non-market goods and services that are publicly owned. Publicly owned units producing (all or mostly) market goods and services are not in the government sector but are instead recorded as public corporations.

Comparability

The biggest issue affecting comparability across countries concerns the scope of the government sector. In many countries, hospitals, for example, are classified outside of

the government sector and are instead recorded as public corporations; on the grounds that they charge market prices for their services. How significant this is for international comparisons of GGE ultimately depends on the share of goods and services provided to the market, as general government expenditure will still record payments to the hospitals for these services. This is an important point as the guidance provided in the SNA on the delineation of units between market and non-market providers (which refers to most output being non-market) provides scope for differences in country practices. EU countries have adopted a 50% rule for “most” in this context.

Another potential area where comparability may be affected relates to the determination of public ownership. The SNA requires that “control” be the determining factor and describes a number of criteria that can be used to assess this requirement. Recognising that this is non-trivial it includes a practical recommendation that a 50% rule relating to share ownership should be adopted. However, in practice, countries may still choose to measure ownership on the basis of other determining criteria.

For most general government expenditures there is little scope for ambiguity in treatment and the quality of underlying data is very good, so the level of comparability is generally good.

Data for all countries are on a consolidated basis, except Canada (which consolidates only current transfers) and New Zealand.

In Figure 16.1, “social benefits and social transfers in kind” is to be completed by “for products supplied to households via market producers”.

17. General government expenditure by function

Section 16 presented information on total general government expenditure. But breakdowns of these expenditures on the basis of the activities they support is also of considerable interest to policy makers and analysts. The classification system used to provide this breakdown on an internationally comparable basis is known as the Classification of Functions of Government (COFOG). It provides a means to compare expenditures on specific functions, such as public order and safety, for example, in a comparable way across countries and over time.

Definition

Total general government expenditure (GGE) is defined in Section 16.

COFOG is available at two levels: A first level which splits expenditures into ten functional classes, and a second level which further splits the first level classes into up to nine further classes, as shown below:

General public services, which includes: Executive and legislative organs, financial and fiscal affairs, external affairs, Foreign economic aid; General services; Basic research; R&D general public services; General public services not elsewhere classified (n.e.c), Public debt transactions and Transfers of a general character between different levels of government.

Defence includes: Military defence, Civil defence, Foreign military aid, R&D defense and Defence n.e.c.

Public order and safety covers: Police services, Fire-protection services, Law courts, Prisons, R&D public order and safety and Public order and Safety n.e.c.

Economic affairs which includes: General economic, commercial and labour affairs, Agriculture, forestry, fishing and hunting, Fuel and energy, Mining, manufacturing and construction, Transport, Communication, Other industries, R&D economic affairs and Economic affairs n.e.c.

Environmental protection includes: Waste management, Waste water management, Pollution abatement, Protection of biodiversity and landscape, R&D environmental protection and Environmental protection n.e.c.

Housing and community amenities covers: Housing development, Community development, Water supply, Street lighting, R&D housing and community amenities, Housing and community amenities n.e.c.

Health, which includes: Medical products, appliances and equipment, Outpatient services, Hospital services, Public health services, R&D health, and Health n.e.c.

Recreation, culture and religion, includes: Recreational and sporting services, Cultural services, Broadcasting and publishing services, Religious and other community

services, R&D recreation, culture and religion, Recreation, and culture and religion n.e.c.

Education, which covers: Pre-primary and primary education, Secondary education, Post-secondary non-tertiary education, Tertiary education, Education not definable by level, Subsidiary services to education, R&D education, and Education n.e.c.

Social protection, includes: Sickness and disability, Old age, Survivors, Family and children, Unemployment, Housing, Social exclusion n.e.c., R&D social protection, and Social protection n.e.c.

Comparability

The biggest issue affecting comparability across countries concerns the scope of the government sector. In many countries, hospitals, for example, are classified outside of the government sector and are instead recorded as public corporations; on the grounds that they charge market prices for their services. This may impact on comparisons of expenditures of total government and breakdowns by function, especially if the public corporations produce very little non-market services and require little additional financing or subsidies from government.

For the United States expenditures on environment protection are included in expenditures for housing and community amenities.

Data for all countries are on a consolidated basis, except Canada (which consolidates only current transfers) and New Zealand.

Data are on a fiscal basis for Japan.

18. Taxes

In the SNA, taxes are compulsory unrequited payments, in cash or in kind, made by institutional units to the general government exercising its sovereign powers or to a supranational authority. And generally constitute the major part of government revenue in most countries. Social security contributions, which although being compulsory payments to general government, are not treated as taxes in the SNA because the receipt of social security benefits depends, in most countries, upon appropriate contributions having been made, even though the size of the benefits is not necessarily related to the amount of the contributions. However, many policy makers and users prefer to define taxes to include social security contributions. Indeed this is the basis of tax measures used in the OECD *Revenue Statistics* publication. This partly reflects the fact that the contributions to general government are compulsory but also because not all countries operate social security schemes, choosing instead to finance social benefits paid by government through other taxes or revenue (see also Section 19).

From a practical policy perspective, definitions of taxes that include social security contributions are generally preferred. This section however focuses on the SNA definition.

Definition

The SNA describes three categories of taxes:

- The first category, *taxes on production and imports*, historically referred to as indirect taxes, is broken down into two components in the SNA: *taxes on products*, such as VAT, and other *taxes on production* such as taxes on the ownership or use of land, buildings or other assets used in production or on labour employed (payroll tax).
- The second category, *current taxes on income, wealth, etc.*, consists mainly of taxes levied on the incomes of households and corporations. The category is not described simply as “current taxes on income and wealth” because it includes periodic taxes on households that are assessed neither on the income nor the wealth of the household or its members, for example, poll taxes.
- The final category, *capital taxes*, consists of taxes levied at irregular and very infrequent intervals on the values of assets or net worth owned by or transferred between units, such as inheritance taxes and betterment levies, e.g. taxes on the increase in the value of land resulting from planning permission.

Definition of taxes used in OECD Revenue Statistics

The Revenue Statistics definition differs from the SNA in the following respects:

- Includes social contributions paid to government.
- Adopts different views on whether some fees and licenses at the margin are taxes.
- Excludes imputed taxes/subsidies related to the operation of official multiple exchange rates.
- Nets off some tax credits within overall taxes that the SNA records as government expenditure.

Comparability

Generally the comparability of taxes across countries is good but the rules that delineate taxes from revenues, (typically those relating to fees/licenses) may at the margin, cause some comparability issues. In general, if the issue of a licence involves little work by government the related fee should be recorded as a tax. But if government provides some service associated with, and in proportion to the size of, the fee, it is treated as a purchase of services.

Fees for licenses to use natural resources (radio spectra, land, fish) are nearly always recorded as rent or payments for an asset and not as taxes. But not all, e.g. licenses for recreational, as opposed to commercial, fishing. Indeed, payments by persons or households for licences to own or use vehicles, boats or aircraft and for licences for recreational hunting, shooting or fishing are treated as taxes. Fees for licenses to engage in a specific activity (e.g. to operate a taxi or casino) are generally treated as a tax. Payments for all other kinds of licences (e.g. driving, television, firearm) or fees to government (e.g. payments for passports) are generally but not universally treated as payments for services.

The chart shows general government revenue (taxes plus other government receipts/revenues) = general government expenditure +/- net lending (borrowing), as a percentage of GDP.

19. Social contributions

Social contributions are actual or imputed payments to social insurance schemes to make provision for social insurance benefits (see Section 18). They may be made by employers on behalf of their employees or by employees, self-employed or non-employed persons on their own behalf. The contributions may be compulsory or voluntary and the schemes may be funded or unfunded. Compulsory social security contributions paid to general government or to social security funds under the effective control of government form an important part of government revenue and, although they are not treated so in the SNA, many analysts (including the OECD's Tax Directorate) consider the payments as being analogous to a tax on income and so part of a country's overall tax burden. They are important not only in the sense that they form a significant share of government revenue but also because they reflect part of the costs of doing business. In many developing countries high social contributions coupled with low social benefits are often cited as a reason for a large informal economy.

Definition

Social insurance schemes may be managed by any sector and the schemes may be funded or unfunded. Moreover the contributions paid to the schemes may be compulsory or voluntary. Typically the most important types of schemes are social security schemes; i.e. those imposed, controlled and financed by government. But in many countries the role of private funded or unfunded schemes is growing.

Social security funds established for social security schemes are separate institutional units in the SNA, forming a subcomponent of the government sector. Although contributions to the scheme are obligatory, payments can be made to the funds on a voluntary basis to qualify for social security benefits. Social insurance schemes organised by government for their own employees are classified as private funded or unfunded schemes as appropriate. As such, they may be part or not of government, depending on certain criteria.

Comparability

Not all countries operate social security schemes. Some may choose instead to finance social benefits paid by government through other taxes or revenue; which is one of the reasons why analysts often prefer to show the totality of taxes and social contributions in calculating the tax burden. But even these comparisons should be interpreted carefully. Governments may encourage employers and employees to opt out of social security schemes and instead pay contributions, even if compulsory, to schemes managed by corporations, thus reducing the revenues and expenditures of government, without necessarily reducing the well-being of households. This is one of the reasons why comparisons of taxes on income are often shown as rates, with the component for social contributions reflecting the compulsory rate irrespective of whether the associated scheme is managed by government or corporations.

In Finland, Iceland and the Netherlands, some contributions are levied as a function of taxable income (i.e. gross wage earnings after most/all tax reliefs). Australia and New Zealand do not levy social security contributions.

The figures shown include both voluntary and compulsory social contributions paid to government.

20. Social benefits

Social benefits reflect current transfers to households in cash or in kind to provide for the needs that arise from certain events or circumstances, for example sickness, unemployment, retirement, housing, education or family circumstances that may adversely affect the well-being of the households concerned either by imposing additional demands on their resources or by reducing their incomes. Transfers are typically made by governments and NPISH, and they form a significant share of total general government expenditure and households disposable income; particularly for the lower income groups of society. They are an important factor in analyses of households' welfare and income inequality and the redistributive role of government.

Definition

The National Accounts have two distinct categories of Social benefits: the first is *Social benefits other than social transfers in kind*. The second is *Social transfers in kind* (see also Sections 6, 10 and 11). The distinction between the two is important. Transfers relating to the former are typically in cash and so allow households to use the cash indistinguishably from income coming from other sources, whereas transfers under the latter are always related to the provision of a certain good or service, and so households have no discretion over their use.

Social benefits other than social transfers in kind is further broken down into two key components: *Social insurance benefits and social assistance benefits in cash*.

The latter consist of cash transfers made by government units or NPISHs to households to meet the same kinds of needs as social insurance benefits but where the households or needs are outside of any social insurance scheme or where the social insurance benefits are not considered sufficient to cover the needs. It does not include payments to government/NPISH employees in their capacity as current or former employees.

The SNA breaks down *Social insurance benefits* into three further categories: *Social Security benefits in cash*; *Unfunded employee social insurance benefits*; and *Private funded social insurance benefits*. The first two are most relevant for government and the first, in particular, reflects a significant proportion of government expenditure. It includes cash payments for: sickness and invalidity benefits; children, family, dependants' and maternity allowances; unemployment benefits; pensions; and death benefits. *Unfunded employee social insurance benefits* include cash or in kind payments to employees for similar circumstances including payments on general medical services not related to the

employee's work. Government as an employer incurs expenditures here, typically reflecting employee pensions.

Social transfers in kind reflect payments for individual goods and services such as education, health and housing, provided by government and NPISHs, to households either free or at prices that are not economically significant.

Comparability

Whilst there are significant differences between *Social transfers in kind* and *Social benefits other than social transfers in kind vis-à-vis* households' choice, they are not entirely mutually exclusive in a policy context. Governments for example can provide pensions that include a free housing component (and this component would be recorded as a social transfer in kind), rather than a pension in cash that allows the recipient to pay a market rent. Similarly some governments provide food coupons, which would be recorded as a social transfer in kind, instead of cash benefits.

This suggests that international comparisons of social benefits should focus on the totality, those in kind and in cash. Indeed comparisons of the components of *social benefits other than social transfers in kind* should be attempted with some caution as the coverage of people and consequences/needs in social insurance schemes varies across countries. A further caveat concerns social benefits paid to government employees as these can be delivered through private funded rather than unfunded schemes.

Moreover, in practice not all countries record all *social transfers in kind* in the same way. Some countries treat the reimbursements on some individual goods and services as transfers in cash; with the reimbursed component forming part of household final consumption and not general government final consumption. Total general government expenditure, households' actual final consumption, adjusted disposable income and saving are unaffected by these differences however.

21. Gross saving and net lending/net borrowing

The concepts of saving and net-lending are introduced in Sections 7 and 9 respectively. However they are reintroduced in this section on General Government to reflect the particular importance these concepts have in the area of government finances. Saving is typically associated with the “Golden Rule” concept, namely that government current expenditures minus current receipts (such as taxes) should net out over the course of an economic cycle. Net lending/borrowing reflects the fiscal position after accounting for capital expenditures. Net-lending means that government is providing financial resources to other sectors and net-borrowing means that government requires financial resources from other sector.

It's important to note in this context that whilst general government saving and net lending/borrowing are important concepts in the SNA accounting framework and provide the basis for sound international comparisons, they are not necessarily the key fiscal measures targeted by governments. Some countries for example manage their budgets using broader notions that incorporate the positions of public corporations and others focus on more narrow concepts such as central government. The European Commission uses the net-lending concept to monitor government fiscal surpluses/deficits with an additional adjustment to reflect net streams of interest payments resulting from swaps arrangements and forward rate agreements.

Definition

Gross saving = Disposable income *minus* general government final consumption

= Current receipts *minus* current expenditure (except depreciation)

Net-lending = Gross saving *plus* net capital transfers (receivable *minus* payable) *minus* gross capital formation *minus* acquisitions less disposals of non-produced non-financial assets

= Total general government revenue *minus* total general government expenditure

= Net acquisition of financial assets *minus* net incurrence of liabilities.

Comparability

The biggest issue affecting comparability across countries concerns the scope of the government sector. In many

countries, hospitals, for example, are classified outside of the government sector and are instead recorded as public corporations; on the grounds that they charge market prices for their services. This is an important point as the guidance provided in the SNA on the delineation of units between market and non-market providers (which refers to most output being non-market) provides scope for differences in country practices. EU countries have adopted a 50% rule for “most” in this context.

Another potential area where comparability may be affected relates to the determination of public ownership. The SNA requires that “control” be the determining factor and describes a number of criteria that can be used to assess this requirement. Recognising that this is non-trivial it includes a practical recommendation that a 50% rule relating to share ownership should be adopted. However, in practice, countries may still choose to measure ownership on the basis of other determining criteria.

Generally however the comparability of net-lending/borrowing and saving figures for countries is very high.

In Ireland, in 2010, the government made massive capital transfers to Anglo Irish Bank, Irish Nationwide Building Society and EBS Building Society, which had a big impact on the government net lending figures.

22. Financial assets and liabilities

The amount of financial assets and liabilities held by government has significant political and economic importance. The assets reflect a source of additional income available to government and a source of funds that it can draw on without necessarily increasing liabilities, for example as an additional lever to protect its currency when money markets exert prohibitive upward pressure on bond yields say. The liabilities reflect the debts accumulated by government and, so, provide an indication of the structural nature of debt interest payments (which add to government deficit). This matters because, in general, the higher the liabilities the higher the perceived risk of default (and therefore the higher the risk premium required by the market). Typically, this cycle can eventually force governments to either cut spending or raise taxes. General government gross debt's importance, and, in particular, the importance of sustainable levels of debt, is reflected in the European Maastricht criteria, where it is one of the two measures referred to in the Excessive Deficit Procedure.

Definition

The SNA defines the following as financial assets: monetary gold and special drawing rights; currency and deposits; securities other than shares; shares and other equity; loans; insurance technical reserves; and other accounts receivable/payable.

The valuations of both assets and liabilities in the balance sheets should be at the market prices at the end of the year and preferably with the accounts consolidating assets and liabilities between all general government sectors.

The measure used by the European Commission as part of the excessive debt procedure (General Government Gross Debt) is also consolidated but is based on nominal valuations, that is, the amount contractually agreed to be repaid by government on maturity. It also excludes any liabilities relating to shares and other equity, insurance technical reserves, and other accounts payable and also financial derivatives (part of securities other than shares).

Comparability

Data are not consolidated for: Chile, Japan, Korea and United Kingdom.

Mexican data are compiled by the Central Bank (Banco de Mexico). All available information is obtained from financial corporations (sector S12) which is the only sector for which Mexico has recorded detailed counterparts data (end of year flows).

CAPITAL

Financial and non-financial assets

- 23. Net capital stock
- 24. Consumption of fixed capital
- 25. Non-financial assets held by households
- 26. Financial assets held by households

23. Net capital stock

Net capital stock reflects the market value of the stock of fixed assets in the economy and as such provides an important indication of overall wealth. It also forms an important input into the derivation of other statistical indicators, such as depreciation and, in some cases, capital services.

Definition

The stock of assets surviving from past periods, and corrected for depreciation is the net (or wealth) capital stock. The net stock is valued as if the capital good (used or new) were acquired on the date to which a balance sheet relates. The net stock is designed to reflect the wealth of the owner of the asset at a particular point in time.

The value of the net stock of produced fixed assets is usually estimated by the *perpetual inventory method* (PIM). The PIM cumulates past flows of gross fixed capital formation (GFCF) in volume terms and corrects them for the retirement of assets and for their loss in value due to ageing and depreciation. Each annual investment is an addition to the stock, while each retirement or deterioration enters as a deduction.

Some countries also compute a measure of the gross capital stock which corresponds to the net stock before depreciation is taken into account. Thus, the gross stock only adjusts for retirements but otherwise treats every asset as if it were new. It is also noteworthy that neither the net nor the gross stock are the conceptually correct measure to capture capital inputs into production – these are best reflected through measures of the flow of capital services (see *Measuring Capital* in “Further reading” for more information).

Comparability

Cross country comparability is driven by three major factors: i) the coverage of fixed assets; ii) the retirement and depreciation profiles used; and iii) for those countries that

use the PIM model, the length of time series available for GFCF by product.

OECD countries use various types of retirement and depreciation functions that may differ in shape and in regard to the average and maximum service lives for different types of assets. For example, some countries use linear depreciation profiles (corresponding to a constant amount of depreciation every period) and others use geometric profiles (corresponding to a constant rate of depreciation every period). However, the use of different parameters and profiles for depreciation does not in itself imply a lack of comparability. There may be very good reasons for these differences. For example, even if one could assume that the buildings in one country were exactly the same as another, one might expect a higher rate of depreciation in a country with extreme temperatures say.

An area where comparability is directly affected concerns the coverage of assets in estimates of net capital stock, and these are not always fully comparable across countries (see Section 12).

24. Consumption of fixed capital

Economically, consumption of fixed capital, (depreciation), is best described as a deduction from income to account for the loss in capital value owing to the use of capital goods in production. Its primary importance in an accounting sense is in its use as the “netting” component in estimates of net domestic product, net national income, etc., as described in earlier sections, and, so, in its ability to permit analyses that are closer to a welfare perspective than gross measures. It also constitutes one part of the costs of capital services and so plays a role in productivity measurement. Moreover it has a direct impact on GDP because estimates of non-market value-added explicitly include a component for depreciation.

Definition

The 1993 System of National Accounts defines consumption of fixed capital (depreciation), in the following way:

Consumption of fixed capital is the decline, during the course of the accounting period, in the current value of the stock of fixed assets owned and used by a producer as a result of physical deterioration, normal obsolescence or normal accidental damage. [...] Losses due to war or to major natural disasters that occur very infrequently [...] are not included under consumption of fixed capital. [...]

It further states that:

The values of the assets lost in these ways are recorded in the other changes in the volume of assets accounts. [...] Consumption of fixed capital is defined in the System in a way that is intended to be theoretically appropriate and relevant for purposes of economic analysis. Its value may deviate considerably from depreciation as recorded in business accounts or as allowed for taxation purposes, especially when there is inflation.

Depreciation in business accounts is typically measured differently from depreciation in the national accounts. The latter measures depreciation by applying a “depreciation coefficient” to the *current value* of each capital asset whereas company accountants typically apply a depreciation coefficient to the value of the capital good at its *original purchase price* (“historic cost”). When the prices of capital goods rise, the difference can therefore be significant.

With the increasing importance of high-tech capital goods that undergo rapid technical change, there has been

renewed discussion about the measurement of depreciation. In particular, some have argued that depreciation should incorporate expected real holding losses on the grounds that this is the appropriate way of capturing expected obsolescence. Others have come to a different conclusion, and draw a distinction between value changes of an asset due to ageing (which they identify with depreciation) and value changes due to overall price changes of the group of capital goods; which corresponds to the position of the SNA and, indeed, the practice of statistical offices.

Comparability

Like estimates of net capital stock, the international comparability of estimates of depreciation are dependent on: i) the coverage of fixed assets; ii) the retirement and depreciation profiles used; and iii) for those countries that use the PIM model, the length of time series available for GFCF by product. Although the comparability of points i) and iii) are generally good across countries (see also Section 12), the assumptions on service lives and depreciation rates differ across countries, although as described in Section 23, there are often sound reasons for such differences, reflecting an economic reality.

25. Non-financial assets held by households

Non-financial assets held by households reflect the assets owned by unincorporated household enterprises and dwellings owned by households, with the latter component forming by far the bulk of non-financial assets held by households. They form an important part of overall wealth and can provide an important additional source of revenue; either through their sale or refinancing, or as income via rentals of residential property for example. Estimates of non-financial assets held by households also play an important role in economic analyses, such as studies of asset bubbles, and analyses of living standards.

Definition

Non-financial assets held by households include in theory both produced and non-produced non-financial assets and therefore include: dwellings and other buildings and structures and land improvements; machinery and equipment including livestock; and even intellectual property products, such as software and literary originals, and non-produced assets such as land and taxi-licenses. In practice dwellings form by far the most significant component.

Except for dwellings, only those assets owned by household unincorporated enterprises, and used in production, are included as non-financial assets. For example a car used by a household purely for household transport is not a non-financial asset whereas a car used by a self-employed taxi driver is.

Non-financial assets are valued in the balance sheets at the market prices of the time of the balance sheet, and are recorded net of depreciation.

Comparability

Information on non-financial assets held by households typically relies on household based surveys and so the quality of such information, except for that pertaining

to dwellings and land, is generally of lower quality than it is for similar information collected on incorporated businesses.

Moreover, in practice, countries use a variety of methods to differentiate between the value of dwellings and the land on which the dwellings sit, meaning that comparisons of these subcomponents across countries are challenging. Some countries, for example the United Kingdom, include the value of land under dwellings within the figures for dwellings. This matters not only for international comparability, and indeed temporal comparisons, but also because dwellings, as produced assets depreciate whereas (most) land, as a non-produced asset, does not. A particular challenge arises from capturing quality change and quality differences in the housing stock and valuing it accordingly.

The caveats above, pertaining to the distinction between land and dwellings, mean that users should be particularly careful in using the relevant figures in making international comparisons. The OECD Statistics Directorate will be working with national statistics institutes so that future versions of this publication reflect a greater degree of international comparability.

Data are net assets for all countries except for Slovak Republic and Poland (gross assets).

26. Financial assets held by households

Financial assets held by households include cash, shares, pension funds, etc., and form an important part of overall wealth and an important source of revenue; either through their sale or refinancing, or other property income via interest and dividends say. Data on financial assets held by households play an important role in economic analyses, such as studies of asset bubbles and analyses of welfare.

Definition

Financial assets held by households include: currency and deposits; securities other than shares; loans; shares and other equity; net equity of households in life insurance reserves; net equity of households in pension funds; prepayments of premiums and reserves against outstanding claims; and other accounts receivable.

Most of the asset classes above are self-explanatory but in the following cases a few additional elaborations are helpful.

Life insurance reserves and pension funds are typically managed by institutions outside of the household sector but the reserves and funds are considered the property of the household sector.

Non-life insurance is treated differently however and only the prepayment of premiums made by households and outstanding claims payable to households are considered as financial assets of the households themselves.

Other accounts receivable typically reflect payments due to households not included elsewhere, such as tax reimbursements, outstanding wages and salaries and often, depending on national practice, interest accruing on deposits and loans that is not capitalised in the underlying asset.

In practice the bulk of financial assets held by households reflects currency and deposits, securities, shares and equity and net equity in life insurance reserves and pension funds.

An important additional item relating to household financial assets, concerns contingencies, in particular, entitlements of households to pensions from unfunded schemes, such as pay as you go social security schemes. In these cases no actual financial reserves hypothecated to a pension fund exist and, so, no financial assets are recorded to the households sector (see Annex B for changes in the 2008 SNA).

Comparability

Comparability is good but data are not always available for all asset-types or not separately identifiable. As such considerable care is needed when making cross country comparisons, not only of totals, but especially of sub-totals.

Furthermore, it has to be noted that in particular institutional differences in the organisation of pension systems across countries may affect a straightforward interpretation of the subcomponents.

The estimates shown in the tables and charts that follow present statistics on a non-consolidated basis (except for Australia and Israel).

ANNEX B

The 2008 SNA – changes from the 1993 SNA

For all OECD countries except Australia, the indicators presented in this publication are based on the 1993 SNA. The 2008 SNA has recently been finalised and includes a number of changes to the 1993 SNA. Although it will be a number of years (2014 for most countries) before the national accounts and this publication reflect these changes, it is all the same instructive to present the key changes (those that will eventually impact on the indicators presented in this publication) here. For Australia, an indication of the size of the changes for the two most significant items (R&D and weapons system) that impact on the indicators is also presented below. A full description of the impact of the 2008 SNA on Australia's accounts can be found at: [www.ausstats.abs.gov.au/Ausstats/subscriber.nsf/0/8DD6B1990BCE6806CA25765D0004DD3F/\\$File/5310055002_September%202009.pdf](http://www.ausstats.abs.gov.au/Ausstats/subscriber.nsf/0/8DD6B1990BCE6806CA25765D0004DD3F/$File/5310055002_September%202009.pdf).

Changes affecting whole economy levels of income, etc.

Research and experimental development: R&D is recognised for the first time as a produced asset. This also means that payments for the acquisition of patents, treated as acquisition or disposal of non produced, non-financial assets in the 1993 SNA, will be treated as transactions in produced assets, R&D. This also has implications for sectoral gross value added as the 2008 SNA also recommends that a separate establishment is distinguished for R&D producers when possible. See also the *OECD Handbook on Deriving Capital Measures of Intellectual Property Products*. For Australia the direct inclusion of R&D as a capital asset raises GDP by between 1 and 1.25 per cent in the most recent years. This is lower than the share of R&D investment as a share of GDP since some investment in R&D is conducted by general government (which amounts to about 0.25 per cent of GDP). Under the 1993 SNA expenditure on R&D by government already adds to government output (which is estimated on a sum of costs basis) and subsequently as general government final consumption. So, for government the direct impact of the capitalisation merely involves a reclassification of expenditure from government final consumption to government gross fixed capital formation. Indirectly however government output and, so GDP, will increase as part of the costs of government include an imputation for depreciation, which now includes a component for the capital stock of R&D by government. This increases government output and general government final consumption by about 0.25 per cent of GDP. The total direct and indirect increase to GDP because of the capitalisation of R&D therefore is between 1.25 and 1.5 per cent.

Weapons systems: Military weapons systems such as vehicles, warships, etc. used continuously in the production of defence (and deterrence) services are recognised as fixed assets in the 2008 SNA (the 1993 SNA recorded these as fixed assets only if they had dual civilian use and as intermediate consumption otherwise). Some single-use items such as

certain types of ballistic missiles with a highly destructive capability, but which provide ongoing deterrence services, are also recognised as fixed assets in the 2008 SNA. Because most if not all of these expenditures are carried out by government (whose output is typically valued by summing costs) GDP will only increase by the related new consumption of fixed capital. In recent years for Australia this increase amounts to less than ¼ per cent of GDP.

For Australia, the total impact of the changes made for R&D and weapons systems as a per cent of total gross fixed capital formation on a 1993 SNA basis increase GFCF by about 5.5 per cent.

Financial Intermediation Services Indirectly Measured (FISIM): The method recommended in the 2008 SNA for the calculation of FISIM implies several changes from that in the 1993 SNA. For example it explicitly recommends that FISIM only applies to loans and deposits provided by/deposited with financial institutions, and that for financial intermediaries all loans and deposits are included, not just those of intermediated funds. In addition, the 2008 SNA no longer allows countries to record FISIM as a notional industry.

Financial services: The 2008 SNA defines financial services more explicitly to ensure that services such as financial risk management and liquidity transformation, are captured.

Output of non-life insurance services: The methodology used to indirectly estimate this activity in the 1993 SNA (premiums plus premium supplements minus claims) could lead to extremely volatile (and negative) series in cases of catastrophic losses. The 2008 SNA recommends a different indirect approach to measurement that better reflects the pricing structures used by insurance companies and the underlying provision of insurance services *per se*. The approach can be simply described as an *ex ante* expectation approach. Output is equal to premiums plus *expected* premium supplements minus *expected* claims. The 2008 SNA also recommends that exceptionally large claims, following a catastrophe, are recorded as capital, rather than current, transfers which will have an impact on (particularly sectoral) estimates of disposable income.

Output of Central Banks: The 2008 SNA has provided further clarification on the calculation of FISIM in calculating the output of Central Banks. Where Central Banks lend or borrow at rates above or below the effective market lending/borrowing rate the 2008 SNA recommends the recording of a tax or subsidy from the counterpart lender/borrower to/from government to reflect the difference between the two rates. Correspondingly a current transfer (the counterpart to the tax/subsidy) is recorded between government and the Central Bank. These flows will have an impact on the distribution of income in national income compared to the 1993 SNA treatment.

Valuation of output for own final use: The 2008 SNA recommends that estimates of output for own final use should include a component for the return to capital as part of the sum of costs approach when comparable market prices are not available. However no return to capital should be included for non-market producers.

Costs of ownership transfer: The 1993 SNA recommended that these costs (treated as GFCF in the accounts) should be written off over the life of the related asset. The 2008 SNA instead recommends that these costs be written off over the period the asset is expected to be held by the purchaser. This will impact on measures of net income and only marginally on gross measures, reflecting the calculation of output for own final use and government output (which is calculated as the sum of costs including depreciation).

Re-allocating income, etc. across categories

Goods sent abroad for reprocessing: The 2008 SNA recommends that imports and exports are recorded on a strict ownership basis. This means that the values of a flow of goods moving from one country (that retains ownership of the goods) to another providing processing services should not be recorded. Only the charge for the processing service should be recorded in the trade statistics. The 1993 SNA imputed an effective change of ownership.

(Pensions) Defined benefit schemes: The 1993 SNA stated that actual social contributions by employers and employees should reflect the amounts actually paid. The 2008 SNA differs, recognising that the amounts actually set aside may not match the liability to the employees. As such the 2008 SNA recommends that the employer's contribution should reflect the increase in the net present value of the pension entitlement plus costs charged by the pension fund minus the employee's own contributions. This change will result in a shift of income between gross operating surplus and compensation of employees and between institutional sectors (corporations/government and households).

Ancillary activities: The 2008 SNA recommends that if the activity of a unit undertaking purely ancillary activities is statistically observable (separate accounts, separate location) it should be recognised as a separate establishment.

Holding companies: The 2008 SNA recommends that holding companies should always be allocated to the financial corporations sector even if all their subsidiary corporations are non-financial corporations. The 1993 SNA recommended that they were assigned to the institutional sector in which the main group of subsidiaries was concentrated.

Exceptional payments from public corporations: The 2008 SNA recommends that these should be recorded as withdrawals from equity when made from accumulated reserves or sales of assets. The 1993 SNA treated such transactions as dividends.

Exceptional payments from governments to quasi public corporations: The 2008 SNA recommends that these should be treated as capital transfers to cover accumulated losses and as additions to equity when a valid expectation of a return in the form of property income exists. The 1993 SNA treated all such payments as additions to equity.

ANNEX C

Glossary of main terms

System of National Accounts, 1993

The definitions in this Glossary are based on the actual wording used in the *System of National Accounts, 1993 (SNA93)*. Where applicable, each definition shows the paragraph of SNA93 from which the definition has been derived.

Term	Definition	Paragraph(s)
Acquisitions	Goods (including assets) and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.	9.32
Actual final consumption of general government	<i>Actual final consumption of general government</i> is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.	9.97 and 9.3
Actual final consumption of households	<i>Actual final consumption of households</i> is the value of the consumption goods and services acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.	9.11 and 9.3 [9.72, 9.96]
Actual final consumption of NPISHs	There is no <i>actual final consumption of NPISHs</i> because, in practice, most of their services are individual in nature and so, for simplicity, all services provided by NPISHs are treated by convention as individual (as social transfers in kind).	9.44 [9.94, 9.95]
Actual individual consumption	<i>Actual individual consumption</i> is measured by the total value of household final consumption expenditure, NPISH final consumption expenditure and government expenditure on individual consumption goods and services.	[9.94]
Adjustment for the change in the net equity of households in pension fund reserves	The <i>adjustment for the change in the net equity of households in pension fund reserves</i> is equal to the total value of the actual social contributions payable into private funded pension schemes plus the total value of contribution supplements payable out of the property income attributed to insurance policy holders (<i>i.e.</i> holders of pension rights) minus the value of the associated service charges minus the total value of the pensions paid out as social insurance benefits by private funded pension schemes; this adjustment is designed to ensure that the balance of pension contributions over pension receipts (<i>i.e.</i> of "transfers" payable over "transfers" receivable) does not enter into household saving.	9.16 [10.30]
Basic price	The <i>basic price</i> is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.	6.205, 15.28 [3.82]
Capital transfers	<i>Capital transfers</i> are transactions, either in cash or in kind, in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, or in which cash is transferred to enable the recipient to acquire another asset, or in which the funds realised by the disposal of another asset are transferred.	10.29 [3.22, 8.3]
Chain indices	<i>Chain indices</i> are obtained by linking price (or volume) indices for consecutive periods; the short-term movements which are linked are calculated using weighting patterns appropriate to the periods concerned.	16.41
Changes in inventories (including work-in-progress)	<i>Changes in inventories (including work-in-progress)</i> consist of changes in: <i>a</i>) stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways; and <i>b</i>) stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing; they are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.	10.7 and 10.28

Term	Definition	Paragraph(s)
Collective consumption service	A <i>collective consumption service</i> is a service provided by general government simultaneously to all members of the community or to all members of a particular section of the community, such as all households living in a particular region.	9.43
Compensation of employees	<i>Compensation of employees</i> is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.	7.21 [7.31]
Constant prices	<i>Constant prices</i> are obtained by directly factoring changes over time in the values of flows or stocks of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (<i>i.e.</i> changes in "constant price terms"); the term "at constant prices" commonly refers to series which use a fixed-base Laspeyres formula.	16.2
Consumption of fixed capital	<i>Consumption of fixed capital</i> represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.	10.27 [6.179, 10.118]
Current transfers	<i>Current transfers</i> consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.	8.32 [3.22, 8.3, 10.133]
Current transfers from/to abroad	<i>Current transfers</i> which take place between resident and non-resident institutional units are referred to as current transfers <i>from/to abroad</i> .	8.4
Disposable income	<i>Disposable income</i> is derived from the balance of primary incomes of an institutional unit or sector by adding all current transfers, except social transfers in kind, receivable by that unit or sector and subtracting all current transfers, except social transfers in kind, payable by that unit or sector; it is the balancing item in the Secondary Distribution of Income Account.	8.11
Disposals	<i>Disposals</i> of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells or transfers any of the assets to another institutional unit; when the ownership of an existing fixed asset is transferred from one resident producer to another, the value of the asset sold, bartered or transferred is recorded as negative gross fixed capital formation by the former and as positive gross fixed capital formation by the latter.	10.40 [9.32]
Employee	An <i>employee</i> is a person who enters an agreement, which may be formal or informal, with an enterprise to work for the enterprise in return for remuneration in cash or in kind.	7.23
Exports of goods and services	<i>Exports of goods and services</i> consist of sales, barter, or gifts or grants, of goods and services from residents to non-residents; the treatment of exports and imports in the SNA is generally identical with that in the balance of payments accounts as described in the Balance of Payments Manual.	14.88 [14.91, 14.94]
External balance of goods and services	The <i>external balance of goods and services</i> is the value of exports of goods and services less imports of goods and services.	2.166 and Table 2.3 V.1
Factor cost	Gross value added at <i>factor cost</i> is not a concept used explicitly in the SNA but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.	6.229
Final consumption	<i>Final consumption</i> consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.	1.49
Final consumption expenditure of government	<i>Government final consumption expenditure</i> consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.	9.94
Final consumption expenditure of households	<i>Household final consumption expenditure</i> consists of the expenditure, including imputed expenditure, incurred by resident households on individual consumption goods and services, including those sold at prices that are not economically significant.	9.94 [9.45]
Final consumption expenditure of NPISHs	<i>Final consumption expenditure of NPISHs</i> consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.	9.94
Financial intermediation services indirectly measured (FISIM)	<i>Financial intermediation services indirectly measured (FISIM)</i> is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.	6.124
Full-time equivalent employment	<i>Full-time equivalent employment</i> is the number of full-time equivalent jobs, defined as total hours worked divided by average annual hours worked in full-time jobs.	17.14 [15.102, 17.28]
General government	The <i>general government</i> sector consists of the totality of institutional units which, in addition to fulfilling their political responsibilities and their role of economic regulation, produce principally non-market services (possibly goods) for individual or collective consumption and redistribute income and wealth.	2.20
Government final consumption expenditure	<i>Government final consumption expenditure</i> consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.	9.94
Gross	The term " <i>gross</i> " is a common means of referring to values before deducting consumption of fixed capital (generally used as in "gross capital stock" or "gross domestic product"); all the major balancing items in the accounts from value added through to saving may be recorded gross or net.	6.201
Gross capital formation	<i>Gross capital formation</i> is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.	10.32

Term	Definition	Paragraph(s)
Gross domestic product (GDP) – expenditure based	<i>Expenditure-based gross domestic product</i> is total final expenditures at purchasers' prices (including the fob value of exports of goods and services), less the fob value of imports of goods and services.	6.235
Gross domestic product (GDP) – income based	<i>Income-based gross domestic product</i> is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.	2.222
Gross domestic product (GDP) – output based	<i>Output-based gross domestic product</i> is the sum of the gross values added of all resident producers at basic prices, plus all taxes less subsidies on products.	6.235 – 6.237
Gross domestic product at market prices	<i>Gross domestic product at market prices</i> is the sum of the gross values added of all resident producers at market prices, plus taxes less subsidies on imports.	6.235 – 6.237
Gross fixed capital formation	<i>Gross fixed capital formation</i> is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.	10.33 and 10.51 [10.26]
Gross national disposable income	<i>Gross national disposable income</i> may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.	8.16 [2.183]
Gross national income (GNI)	<i>Gross national income (GNI)</i> is GDP less net taxes on production and imports, less compensation of employees and property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; [note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally].	2.81 and 7.16 and Table 7.2 [2.181]
Gross saving	<i>Gross saving</i> is gross disposable income less final consumption expenditure.	9.2
Gross value added	<i>Gross value added</i> is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector; gross value added is the source from which the primary incomes of the SNA are generated and is therefore carried forward into the primary distribution of income account.	1.6 [2.172, 6.4, 6.222]
Gross value added at basic prices	<i>Gross value added at basic prices</i> is output valued at basic prices less intermediate consumption valued at purchasers' prices.	6.226, 15.37 [6.231]
Gross value added at producers' prices	<i>Gross value added at producers' prices</i> is output valued at producers' prices less intermediate consumption valued at purchasers' prices.	6.227, 15.37
Household final consumption expenditure	<i>Household final consumption expenditure</i> consists of the expenditure, including imputed expenditure, incurred by resident households on individual consumption goods and services, including those sold at prices that are not economically significant.	9.94 [9.45]
Import duties	<i>Import duties</i> consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.	7.66
Import subsidies	<i>Import subsidies</i> consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.	7.74
Imports of goods and services	<i>Imports of goods and services</i> consist of purchases, barter, or receipts of gifts or grants, of goods and services by residents from non-residents; the treatment of exports and imports in the SNA is generally identical with that in the balance of payments accounts as described in the Balance of Payments Manual.	14.88 [14.91, 14.94]
Income from abroad – net	<i>Net income from abroad</i> is the difference between the total values of the primary incomes receivable from, and payable to, non-residents.	7.15
ISIC	<i>ISIC</i> is the United Nations International Standard Industrial Classification of All Economic Activities; the third revision of ISIC is used in the 1993 SNA.	1.47
Mixed income	<i>Mixed income</i> is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.	7.8 [4.143, 7.81]
National disposable income	<i>National disposable income</i> may be derived from national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.	8.16 [2.183]
National expenditure	Capital formation and final consumption grouped together constitute <i>national expenditure</i> .	2.187
National income	<i>National income</i> is the total value of the primary incomes receivable within an economy less the total of the primary incomes payable by resident units.	7.14

Term	Definition	Paragraph(s)
Net	The term “ <i>net</i> ” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); all the major balancing items in the accounts from value added through to saving may be recorded gross or net; it should be noted, however, that the term “net” can be used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.	6.201
Net borrowing	<i>Net borrowing</i> See “net lending”.	
Net income from abroad	<i>Net income from abroad</i> is the difference between the total values of the primary incomes receivable from, and payable to, non-residents.	7.15
Net lending	<i>Net lending</i> is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.	2.137 and Tables 2.1 III.1 and 10.30
Net national disposable income	<i>Net national disposable income</i> may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.	8.16
Net national income	The aggregate value of the balances of net primary incomes summed over all sectors is described as <i>net national income</i> .	7.16 and Table 7.2 [2.182]
Net saving	<i>Net saving</i> is net disposable income less final consumption expenditure.	9.2
Non-profit institutions serving households (NPISHs)	<i>Non-profit institutions serving households (NPISHs)</i> consist of NPIs which are not predominantly financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.	4.64 and 4.65 [2.20]
NPISH final consumption expenditure	<i>Final consumption expenditure of NPISHs</i> consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.	9.94
Operating surplus	The <i>operating surplus</i> measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).	7.8
Primary incomes	<i>Primary incomes</i> are incomes that accrue to institutional units as a consequence of their involvement in processes of production or ownership of assets that may be needed for purposes of production.	7.2
Purchasing power parity (PPP)	A <i>purchasing power parity (PPP)</i> is a price relative which measures the number of units of country B's currency that are needed in country B to purchase the same quantity of an individual good or service as 1 unit of country A's currency will purchase in country A.	16.82
Real gross domestic income (real GDI)	<i>Real gross domestic income (real GDI)</i> measures the purchasing power of the total incomes generated by domestic production (including the impact on those incomes of changes in the terms of trade); it is equal to gross domestic product at constant prices plus the trading gain (or less the trading loss) resulting from changes in the terms of trade.	16.152
Rebasing	In the course of time, the pattern of relative prices in the base period tends to become progressively less relevant to the economic situations of later periods to the point at which it becomes unacceptable to continue using them to measure volume measures from one period to the next; it may then be necessary to update the base period, a process which is commonly referred to as “ <i>rebasing</i> ”.	16.31
Saving	<i>Saving</i> is disposable income less final consumption expenditure (or adjusted disposable income less actual final consumption), in both cases after taking account of an adjustment for pension funds; saving is an important aggregate which can be calculated for each institutional sector or for the whole economy.	9.17 [1.10, 9.2, 9.19]
Self-employed workers	<i>Self-employed workers</i> are persons who are the sole owners, or joint owners, of the unincorporated enterprises in which they work, excluding those unincorporated enterprises that are classified as quasi-corporations.	7.24
SNA (<i>System of National Accounts</i>)	The <i>System of National Accounts (SNA)</i> consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules.	1.1
Subsidies	<i>Subsidies</i> are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.	7.71 [15.52]
Subsidies on production – other	<i>Other subsidies on production</i> consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (<i>e.g.</i> subsidies on payroll or workforce or subsidies to reduce pollution).	7.79

Term	Definition	Paragraph(s)
Subsidies on products – other	<i>Other subsidies on products</i> (other than export or import subsidies) consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: <i>a)</i> subsidies on products used domestically; <i>b)</i> losses of government trading organisations; and <i>c)</i> subsidies to public corporations and quasi-corporations.	7.78
<i>System of National Accounts</i> (SNA)	The <i>System of National Accounts (SNA)</i> consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules.	1.1
Taxes	<i>Taxes</i> are compulsory, unrequited payments, in cash or in kind, made by institutional units to government units; they are described as unrequited because the government provides nothing in return to the individual unit making the payment, although governments may use the funds raised in taxes to provide goods or services to other units, either individually or collectively, or to the community as a whole.	7.48 [8.43]
Taxes on production and imports	<i>Taxes on production and imports</i> consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus taxes and duties on imports that become payable when goods enter the economic territory by crossing the frontier or when services are delivered to resident units by non-resident units; they also include other taxes on production, which consist mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.	7.49
Taxes on products	<i>Taxes on products</i> , excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation.	7.69, 15.47
Total final consumption	<i>Total final consumption</i> is the total value of all expenditures on individual and collective consumption goods and services incurred by resident households, resident NPISHs and general government units; it may also be defined in terms of actual final consumption as the value of all the individual goods and services acquired by resident households plus the value of the collective services provided by general government to the community or large sections of the community.	9.98
Trading gains and losses	<i>Trading gains and losses</i> arise from changes in a country's terms of trade; for example, if the prices of a country's exports rise faster (or fall more slowly) than the prices of its imports (<i>i.e.</i> if its terms of trade improve) then an increased volume of imports of goods and services can be purchased by residents out of the receipts generated by a given level of exports.	16.152
Valuables	<i>Valuables</i> are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.	(AN.13) – Annex to Chapter XIII [10.7, 10.116, 13.15, 13.50]
Wages and salaries	<i>Wages and salaries</i> consist of the sum of wages and salaries in cash and wages and salaries in kind.	7.33 and 7.37
Wages and salaries in cash	<i>Wages and salaries in cash</i> consist of wages or salaries payable at regular weekly, monthly or other intervals, including payments by results and piecework payments; plus allowances such as those for working overtime; plus amounts paid to employees away from work for short periods (<i>e.g.</i> on holiday); plus <i>ad hoc</i> bonuses and similar payments; plus commissions, gratuities and tips received by employees.	7.33
Wages and salaries in kind	<i>Wages and salaries in kind</i> consist of remuneration in the form of goods and/or services that are not necessary for work and can be used by employees in their own time, and at their own discretion, for the satisfaction of their own needs or wants or those of other members of their households.	7.39

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

The OECD is a unique forum where governments work together to address the economic, social and environmental challenges of globalisation. The OECD is also at the forefront of efforts to understand and to help governments respond to new developments and concerns, such as corporate governance, the information economy and the challenges of an ageing population. The Organisation provides a setting where governments can compare policy experiences, seek answers to common problems, identify good practice and work to co-ordinate domestic and international policies.

The OECD member countries are: Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The European Union takes part in the work of the OECD.

OECD Publishing disseminates widely the results of the Organisation's statistics gathering and research on economic, social and environmental issues, as well as the conventions, guidelines and standards agreed by its members.

National Accounts at a Glance 2013

National Accounts at a Glance presents information using an “indicator” approach, focusing on cross-country comparisons. The aim being to make the national accounts more accessible and informative, whilst, at the same time, taking the opportunity to present the conceptual underpinning of, and comparability issues inherent in, each of the indicators presented.

The range of indicators reflects the richness inherent in the national accounts dataset and encourages users to refocus some of the spotlight that is often placed on gross domestic product (GDP) to other economic important indicators, which may better respond to their needs. The publication is broken down into six key chapters, and provides indicators related to GDP, income, expenditure, production, government and capital respectively.
